

EVAL6230QR demonstration board**Introduction**

This application note describes the demonstration board of the DMOS driver for the three-phase brushless DC motor driver L6230Q. The board implements a typical application which can be used as a reference design to drive three-phase brushless DC motors with currents up to 1 A DC.

Thanks to the small footprint of the L6230Q (QFN 5x5 mm) the PCB is very compact (32x31 mm).

1 Demonstration board description

Table 1. EVAL6230QR: pin connections

| Name | Type | Function |
|--------|-------------------|---|
| VS | Power supply | Power supply voltage. |
| PGND | Ground | Power ground terminal. |
| VS_FB | Analog output | Supply voltage feedback (1/115 divider ratio) |
| EN | Logic input | Chip enable (active 'H'). When 'L' switches OFF all power DMOS. |
| IN1 | Logic input | Logic input half bridge 1. |
| EN1 | Logic input | Enable input half bridge 1. |
| IN2 | Logic input | Logic input half bridge 2. |
| EN2 | Logic input | Enable input half bridge 2. |
| IN3 | Logic input | Logic input half bridge 3. |
| EN3 | Logic input | Enable input half bridge 3. |
| DIAG | Open-drain output | Diagnostic pin. When 'L' signals an overcurrent or overtemperature event. |
| CPOUT | Open-drain output | Open-drain output of internal comparator. |
| CP- | Analog input | Inverting input of internal comparator. |
| CP+ | Analog input | Non-inverting input of internal comparator. |
| SENSE1 | Analog output | Half bridge 1 source pin. |
| SENSE2 | Analog output | Half bridge 2 source pin. |
| SENSE3 | Analog output | Half bridge 3 source pin. |
| OUT1 | Power output | Output half bridge 1. |
| OUT2 | Power output | Output half bridge 2. |
| OUT3 | Power output | Output half bridge 3. |

Figure 2. EVAL6230QR connector description

The EN pin is chip enable (active high). The EN_x pins enable the corresponding half-bridge. When low logic level is applied, the half bridge output is in high-impedance status (both high and low side MOS turned off).

The IN_x input pins drive the corresponding half bridge. When low logic level is applied, the low side MOS is switched on, whereas a high logic level turns on the high side MOS.

A general purpose comparator is integrated in the IC, its inputs and open-drain output are available on CP-, CP+, and CPOUT. It can be used for the current control or BEMF zero crossing detection (refer to the L6230; *DMOS driver for three-phase brushless DC motor*, datasheet for more details).

The power supply feedback and sensing signals are available for external conditioning, for example, to perform a field oriented control driving method.

Table 2 summarizes the electrical specification of the application, *Figure 3* shows the electrical schematic and *Table 3* contains the parts list.

Table 2. EVAL6230QR: electrical specification (recommended values)

| Parameter | Value |
|---|-------------------|
| Supply voltage range (VS) | 8 to 52 Vdc |
| RMS output current rating (OUTx) | up to 1.4 A |
| Switching frequency | up to 100 kHz |
| Input and enable voltage range | 0 to +5 V |
| Comparator input voltage range | 0 to +5 V |
| Operating temperature range | -25 °C to +125 °C |
| L6230Q thermal resistance junction to ambient | 42 °C/W |

Figure 3. EVAL6230QR board schematic

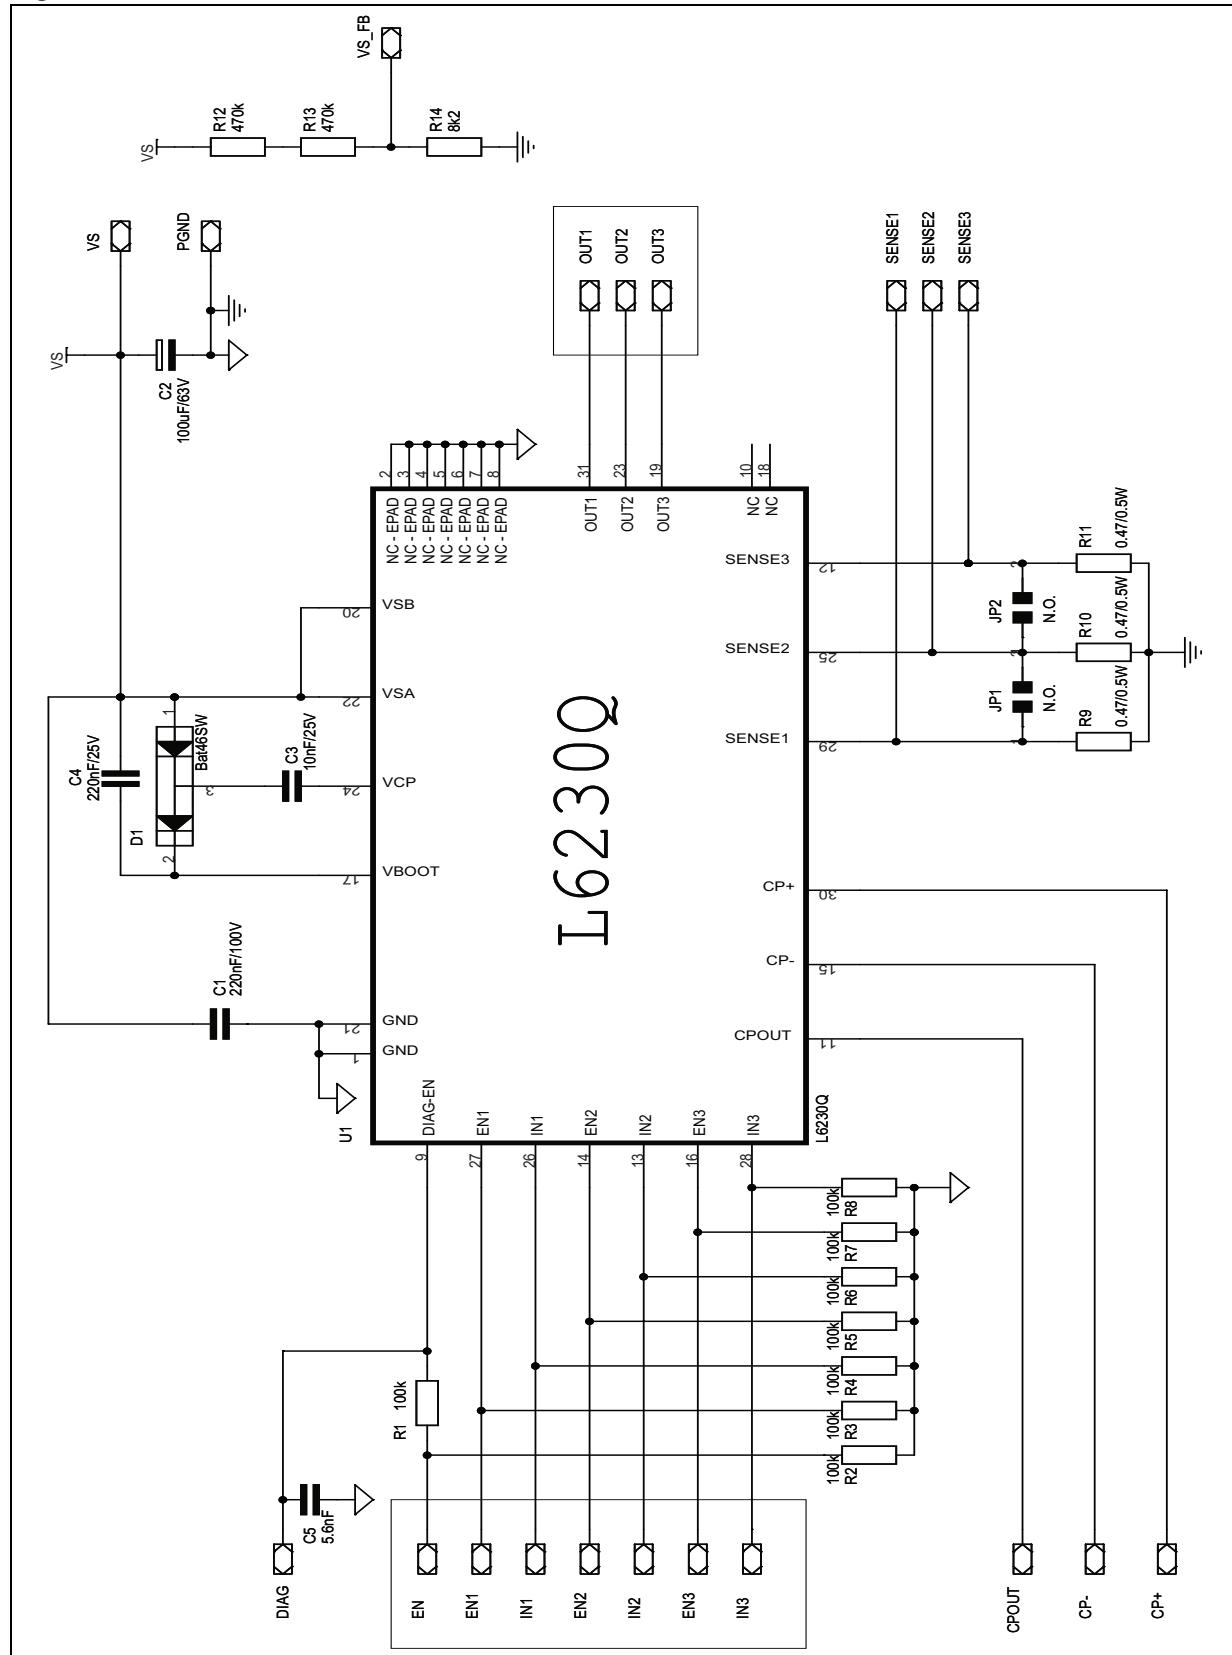

Table 3. EVAL6230QR parts list

| Part reference | Part value | Part description |
|----------------|---------------------------|--|
| C1 | 220 nF/100 V | Capacitor |
| C2 | 100 μ F/63 V | Capacitor |
| C3 | 10 nF/25 V | Capacitor |
| C4 | 220 nF/25 V | Capacitor |
| C5 | 5.6 nF | Capacitor |
| D1 | BAT46SW | Diodes |
| R1 ÷ R8 | 100 k Ω 5 % 0.25 W | Resistor |
| R9, R10, R11 | 0.47 Ω - 0.5 W | Resistor |
| R12, R13 | 470 k Ω 5 % 0.25 W | Resistor |
| R14 | 8.2 k Ω 5 % 0.25 W | Resistor |
| U1 | L6230Q | Three-phase BLDC motor driver in VFQFPN5x5 |

D1, C3, and C4 realize a charge pump circuit, which generates the supply voltage for the high side integrated MOSFETs. Due to voltage and current switching at relatively high frequency, these components are connected together through short paths in order to minimize induced noise on other circuitries.

R2 and C5 are used by the overcurrent protection integrated circuitry to set the protection timings (enable time, $t_{DISABLE}$, is about 200 μ s and delay time, t_{DELAY} , is about 1 μ s with the values in *Table 3*).

Figure 4, *Figure 5*, and *Figure 6* show the component placement and the two layer layout of the EVAL6230QR demonstration board. A GND area has been used for the IC power dissipation.
